Realization of quantum and affine quantum $\mathfrak{gl}_n$

Jie Du

University of New South Wales

AustMS2012, Ballarat

24–27 September 2012
Motivation

1. Two simple questions associated with the structure of algebras.
   - If an algebra is defined by generators and relations, the realization problem is to reconstruct the algebra as a vector space with hopefully explicit multiplication formulas on elements of a basis;
   - If an algebra is defined in term of a vector space such as an endomorphism algebra, it is natural to seek their generators and defining relations.

2. Examples:
   - Kac–Moody algebras, quantum enveloping algebras (QEAs) ...
   - Endomorphism algebras such as Iwahori–Hecke algebras, $q$-Schur algebras and their generalization, degenerate Ringel–Hall algebras, ....

3. Known realizations: Kac–Moody algebras (Kac, Peng–Xiao,...), the $\pm$-part of quantum enveloping algebras (Ringel, ...), QEA of $\mathfrak{gl}_n$ (Beilinson-Lusztig-MacPherson), ...

4. The approaches are all different. I will talk about the BLM approach in this talk.

207+ pages
The (modified) BLM approach

1. By the quantum Schur–Weyl duality, there exist $\mathbb{Q}(\nu)$-algebra homomorphisms:

$$\xi_r : U(gl_n) \to \text{End}_{\mathcal{H}(r)}(\Omega_n \otimes^r) = S(n, r), \text{ the q-Schur algebra}$$

2. Construct spanning set $\{A(j, r)\}_{A \in \Theta^\pm(n, r)}$ for $S(n, r)$ with certain explicit multiplication formulas with structure constants independent of $r$;

3. Relations similar to the defining relations for $U(gl_n)$ can be derived from these formulas;

4. Consider a quotient $\mathcal{K}(n) \cong \bigoplus_{r \geq 1} S(n, r)$ of $U(gl_n)$ and define a completion $\hat{\mathcal{K}}(n) \cong \prod_{r \geq 1} S(n, r)$;

5. The subspace $\mathcal{A}(n)$ spanned by all $A(j) = \sum_{r \geq 1} A(j, r)$ is a subalgebra of $\hat{\mathcal{K}}(n)$ isomorphic to $U(gl_n)$. 
The affine analogue

1. By the quantum Schur–Weyl duality, there exist $\mathbb{Q}(\nu)$-algebra homomorphisms:

$$\xi_r : U(\widehat{gl}_n) \rightarrow \text{End}_{\mathcal{H}_\Delta(r)}(\Omega_\Delta^{\otimes r}) = S_\Delta(n, r), \text{ the affine q-Schur algebra}$$

2. Construct spanning set $\{A(j, r)\}_{A \in \Theta_\Delta^{\pm}(n, r)}$ for $S_\Delta(n, r)$ with certain explicit multiplication formulas with structure constants independent of $r$ (not enough!);

3. Relations similar to the defining relations for $U(gl_n)$ for Chevalley generators can be derived from these formulas;

4. Let $\mathcal{K}_\Delta(n) = \bigoplus_{r \geq 1} S_\Delta(n, r)$ and define a completion $\widehat{\mathcal{K}}_\Delta(n)$;

5. The subspace $\mathcal{A}(n)$ spanned by all $A(j) = \sum_{r \geq 1} A(j, r)$ is a conjectural subalgebra of $\widehat{\mathcal{K}}_\Delta(n)$ isomorphic to $U(\widehat{gl}_n)$.
Quantum Schur algebras

Let $\mathcal{Z} = \mathbb{Z}[v, v^{-1}]$ be the ring of Laurent polynomials in indeterminate $v$.

- The Hecke algebra $\mathcal{H} = \mathcal{H}(r)$ associated to the symmetric group $\mathfrak{S}_r$ is an associative $\mathcal{Z}$-algebra generated by $T_i, 1 \leq i \leq r - 1$ subject to the relations (where $q = v^2$)

  $$T_i^2 = (q - 1)T_i + q, \quad T_i T_j = T_j T_i, \quad T_i T_{i+1} T_i = T_{i+1} T_i T_{i+1}.$$

Basis $\{T_w\}_{w \in \mathfrak{S}_r}$.

- For each $\lambda \in \Lambda(n, r) := (\mathbb{N}^n)_r$, putting $x_\lambda = \sum_{w \in \mathfrak{S}_\lambda} T_w$, the algebra $S(n, r) := \text{End}_\mathcal{H}(\bigoplus_{\lambda \in \Lambda(n, r)} x_\lambda \mathcal{H})$

  is called the quantum Schur algebra.

- This algebra $\mathcal{Z}$-free with a basis $\phi^d_{\lambda, \mu}$ indexed by triples $(\lambda, d, \mu)$, where $\lambda, \mu \in \Lambda(n, r)$ and $d \in \mathcal{O}_{\lambda, \mu}$. This is seen easily from

  $$S(n, r) = \bigoplus_{\lambda, \mu} \text{Hom}(x_\lambda \mathcal{H}, x_\mu \mathcal{H}) \cong \bigoplus_{\lambda, \mu} x_\lambda \mathcal{H} \cap \mathcal{H} x_\mu.$$
There is a bijection

\[ j : \{ (\lambda, d, \mu) \mid \lambda, \mu \in \Lambda(n, r), d \in \mathcal{D}_{\lambda, \mu} \} \to \Theta(n, r) \]

where \( \Theta(n, r) \) denote the set of matrices over \( \mathbb{N} \) of size \( n \) whose entries sum to \( r \).

For each \( j(\lambda, d, \mu) = A \in \Theta(n, r) \), let \( [A] = v^{d_A} \phi^d_{\lambda, \mu} \), where \( d_A = \sum_{i \geq k, j < l} a_{i,j} a_{k,l} \).

Let \( \Theta^\pm(n, r) = \{ A \in \Theta(n, r) \mid a_{i,i} = 0 \text{ for all } i \} \).

For \( A \in \Theta^\pm(n, r) \) and \( \mathbf{j} \in \mathbb{Z}^n \), define

\[ A(\mathbf{j}, r) = \sum_{\lambda \in \Lambda(n, r-|A|)} v^{\lambda \cdot \mathbf{j}}[A + \text{diag}(\lambda)] \]

The set

\[ \{ A(\mathbf{j}, r) \mid A \in \Theta^\pm(n, r), \mathbf{j} \in \mathbb{N}^n \} \]

forms a spanning set for \( \mathbf{S}(n, r) \).
Theorem (BLM ’90)

Assume $1 \leq h \leq n$. For $i \in \mathbb{Z}, j, j' \in \mathbb{Z}^n$ and $A \in \Theta^\pm(n)$, if we put

$f(i) = f(i, A) = \sum_{j \geq i} a_{h,j} - \sum_{j > i} a_{h+1,j}$, $\alpha_i = e_i - e_{i+1}$, and

$\beta_i = -e_i - e_{i+1}$, then the following identities hold in $S(n, r)$ for all $r \geq 0$:

1. $0(j, r)A(j', r) = v^{j \cdot ro(A)} A(j + j', r)$, $A(j', r)0(j, r) = v^{j \cdot co(A)} A(j + j', r)$.

2. $E_{h,h+1}(0, r)A(j, r) = \sum_{i < h; a_{h+1,i} \geq 1} v^{f(i)} \left[ \begin{array}{c} a_{h,i} + 1 \\ 1 \end{array} \right] (A + E_{h,i} - E_{h+1,i})(j + \alpha_h, r)$

$+ \sum_{i > h+1; a_{h+1,i} \geq 1} v^{f(i)} \left[ \begin{array}{c} a_{h,i} + 1 \\ 1 \end{array} \right] (A + E_{h,i} - E_{h+1,i})(j, r)$

$+ v^{f(h) - j_h - 1} \left( A - E_{h+1,h} \right)(j + \alpha_h, r) - \left( A - E_{h+1,h} \right)(j + \beta_h, r)$

$\cdot \frac{1}{1 - v^{-2}}$

$+ v^{f(h+1) + j_{h+1}} \left[ \begin{array}{c} a_{h,h+1} + 1 \\ 1 \end{array} \right] (A + E_{h,h+1})(j, r)$.

3. $E_{h+1,h}(0, r)A(j, r) = \cdots$.

All formulas are independent of $r$. 
The affine analogue

**Theorem (D–Fu ’10)**

Assume $1 \leq h \leq n$. For $i \in \mathbb{Z}$, $j, j' \in \mathbb{Z}_{\Delta}^n$ and $A \in \Theta_{\Delta}^\pm(n)$, if we put $f(i) = f(i, A) = \sum_{j \geq i} a_{h,j} - \sum_{j > i} a_{h+1,j}$, then the following identities hold in $S_{\Delta}(n, r)$ for all $r \geq 0$:

1. $0(j, r)A(j', r) = \nu^{j \cdot \mathrm{ro}(A)} A(j + j', r)$, $A(j', r)0(j, r) = \nu^{j \cdot \mathrm{co}(A)} A(j + j', r)$.
2. $E_{h,h+1}^\Delta(0, r)A(j, r) = \sum_{i < h; a_{h+1,i} \geq 1} \nu^{f(i)} \left[ a_{h,i} + 1 \right] \left( A + E_{h,i}^\Delta - E_{h+1,i}^\Delta \right)(j + \alpha_{h}^\Delta, r)$

   + $\sum_{i > h+1; a_{h+1,i} \geq 1} \nu^{f(i)} \left[ a_{h,i} + 1 \right] \left( A + E_{h,i}^\Delta - E_{h+1,i}^\Delta \right)(j, r)$

   + $\nu^{f(h) - j_{h-1}} \frac{(A - E_{h+1,h}^\Delta)(j + \alpha_{h}^\Delta, r) - (A - E_{h+1,h}^\Delta)(j + \beta_{h}^\Delta, r)}{1 - \nu^{-2}}$

   + $\nu^{f(h+1) + j_{h+1}} \left[ a_{h,h+1} + 1 \right] \left( A + E_{h,h+1}^\Delta \right)(j, r)$.

3. $E_{h+1,h}^\Delta(0, r)A(j, r) = \ldots$. 

J. Du (UNSW)
Definition

1. Let $\mathcal{K}_\Delta(n)$ be the algebra which has $\mathbb{Z}$-basis $\{[A]\}_{A \in \Theta_\Delta(n)}$ and multiplication defined by $[A] \cdot [B] = 0$ if $\text{co}(A) \neq \text{ro}(B)$, and $[A] \cdot [B]$ as given in $\mathcal{S}_\Delta(n, r)$ if $\text{co}(A) = \text{ro}(B)$ and $r = |A|$.

   - $\mathcal{K}_\Delta(n) \cong \bigoplus_{r \geq 0} \mathcal{S}_\Delta(n, r)$

2. Let $\hat{\mathcal{K}}_\Delta(n)$ be the vector space of all formal (possibly infinite) $\mathbb{Q}(v)$-linear combinations $\sum_{A \in \Xi(\eta)} \beta_A [A]$ which have the following properties: for any $x \in \mathbb{N}_\Delta^n$,

   - The sets $\{A \in \Theta_\Delta(n) \mid \beta_A \neq 0, \text{ro}(A) = x\}$ and $\{A \in \Theta_\Delta(n) \mid \beta_A \neq 0, \text{co}(A) = x\}$ are finite.

   We obtain an associative algebra with identity element, the sum of all diagonal matrices in $\Theta_\Delta(n)$.

   - $\hat{\mathcal{K}}_\Delta(n) \cong \prod_{r \geq 0} \mathcal{S}_\Delta(n, r)$
BLM type basis

**Definition**
For \( A \in \Theta_{\Delta}^{\pm}(n) \) and \( j \in \mathbb{Z}_{\Delta}^n \), define

\[
A(j) := \sum_{\lambda \in \mathbb{N}_{\Delta}^n} \nu^{\lambda \cdot j} [A + \text{diag}(\lambda)] = \sum_{r \geq 0} A(j, r) \in \hat{\mathcal{K}}_{\Delta}(n)
\]

and let \( \mathcal{A}_{\Delta}(n) \) be the subspace of \( \hat{\mathcal{K}}_{\Delta}(n) \) spanned by

\[
\mathcal{B}_{\Delta} = \{ A(j) \mid A \in \Theta_{\Delta}^{\pm}(n), j \in \mathbb{Z}_{\Delta}^n \}.
\]

**Lemma**
The set \( \mathcal{B}_{\Delta} = \{ A(j) \mid A \in \Theta_{\Delta}^{\pm}(n), j \in \mathbb{Z}_{\Delta}^n \} \) forms a basis for \( \mathcal{A}_{\Delta}(n) \).

Call \( \mathcal{B}_{\Delta} \) the BLM basis of \( \mathcal{A}_{\Delta}(n) \).
A realization conjecture

**Theorem**

The algebra homomorphisms $\xi_r : U(\widehat{gl}_n) \to S_\Delta(n, r)$ induce an algebra homomorphism $\xi : U(\widehat{gl}_n) \cong D_\Delta(n) \to \hat{\mathcal{K}}_\Delta(n)$. (It is constructed by the double Ringel–Hall algebras $D_\Delta(n)$.) Restriction gives rise to the following algebra homomorphisms:

1. $\xi : U(\widehat{sl}_n) \to A_\Delta(n)$ (D–Fu);
2. $\xi : H_\Delta(n)_{\geq 0} \to A_\Delta(n)$, $\xi : H_\Delta(n)_{\leq 0} \to A_\Delta(n)$ ([VV]);

**Conjecture**

$\text{Im}(\xi) = A_\Delta(n)$. Equivalently, the $\mathbb{Q}(\nu)$-space $A_\Delta(n)$ is a subalgebra of $\hat{\mathcal{K}}_\Delta(n)$.

- The conjecture is true in the classical ($\nu = 1$) case. We now look at this case.
Loop algebra of $\mathfrak{gl}_n$

- Consider the loop algebra $\mathfrak{gl}_n(\mathbb{Q}) := \mathfrak{gl}_n(\mathbb{Q}) \otimes \mathbb{Q}[t, t^{-1}]$.
- This algebra is identified with the matrix Lie algebra $M_{\Delta n}(\mathbb{Q})$ of all $\mathbb{Z} \times \mathbb{Z}$ matrices $A = (a_{i,j})_{i,j \in \mathbb{Z}}$ with $a_{i,j} \in \mathbb{Q}$ such that
  1. $a_{i,j} = a_{i+n,j+n}$ for $i, j \in \mathbb{Z}$, and
  2. for every $i \in \mathbb{Z}$, the set $\{j \in \mathbb{Z} | a_{i,j} \neq 0\}$ is finite.
- Thus, we obtain a natural action of $\mathfrak{gl}_n$ on $\Omega_{\mathbb{Q}}$. Hence, an action of $\mathcal{U}(\mathfrak{gl}_n)$ on $\Omega_{\mathbb{Q}}^\otimes r$.
- This gives algebra homomorphisms
  $$\eta_r : \mathcal{U}(\mathfrak{gl}_n) \rightarrow S_{\Delta}(n, r)_{\mathbb{Q}} = \text{End}_{\mathbb{Q}[s]}(\Omega_{\mathbb{Q}}^\otimes r)$$
  for every $r \geq 1$.
- Hence, an algebra homomorphism
  $$\eta = \prod_{r \geq 0} \eta_r : \mathcal{U}(\mathfrak{gl}_n) \twoheadrightarrow \mathcal{K}_{\Delta}(n)_{\mathbb{Q}} \cong \prod_{r \geq 1} S_{\Delta}(n, r)_{\mathbb{Q}}.$$
Realization of $\mathcal{U}(\widehat{\mathfrak{gl}_n})$

**Theorem (Deng-D-Fu '11)**

The universal enveloping algebra $\mathcal{U}(\widehat{\mathfrak{gl}_n})$ of the loop algebra $\widehat{\mathfrak{gl}_n}(\mathbb{Q})$ has a basis $\{A[j] \mid A \in \Theta^\pm_\Delta(n), j \in \mathbb{N}^n_\Delta\}$ which satisfies the following multiplication formulas:

1. $0[e_\Delta^t]A[j] = A[j + e_\Delta^t] + \left(\sum_{s \in \mathbb{Z}} a_{t,s}\right)A[j];$

2. $E_{h,h+\varepsilon}^\Delta[0]A[j] = \sum_{a_{h+\varepsilon,i} \geq 1, \forall i \neq h,h+\varepsilon} (a_{h,i} + 1)(A + E_{h,i}^\Delta - E_{h+\varepsilon,i}^\Delta)[j]$

   $\quad + \sum_{0 \leq i \leq j_h} (-1)^i \binom{j_h}{i} (A - E_{h+\varepsilon,h}^\Delta)[j + (1 - i)e_h^\Delta]$

   $\quad + (a_{h,h+\varepsilon} + 1) \sum_{0 \leq i \leq j_{h+\varepsilon}} \binom{j_{h+\varepsilon}}{i} (A + E_{h,h+\varepsilon}^\Delta)[j - ie_{h+\varepsilon}^\Delta],}$
Realization of $\mathcal{U}(\widehat{\mathfrak{g}l}_n)$

**Theorem (Deng-D-Fu)**

\[(3)\]

\[
E_{h,h+mn}[0] A[j] = \sum_{s \not\in \{h, h-mn\}} (a_{h,s+mn} + 1)(A + E_{h,s+mn} - E_{h,s})[0]
\]

\[
+ \sum_{0 \leq t \leq j_h} (a_{h,h+mn} + 1) \binom{j_h}{t} (A + E_{h,h+mn})[j - t e_h^\Delta]
\]

\[
+ \sum_{0 \leq t \leq j_h} (-1)^t \binom{j_h}{t} (A - E_{h,h-mn})[j + (1 - t) e_h^\Delta].
\]

for all $1 \leq h, t \leq n$, $j = (j_k) \in \mathbb{N}_\Delta^n$, $A = (a_{i,j}) \in \Theta_\Delta^\pm(n)$, $\varepsilon \in \{1, -1\}$, and $m \in \mathbb{Z}\setminus\{0\}$.
THANK YOU!
